OneSearch Pipeline — Oikos USA

Automated SEO & SEM Intelligence Pipeline · May 2026

WHAT IS ONESEARCH?

OneSearch is a keyword intelligence framework that unifies a brand's full search presence — SEO and SEM — into a single masterlist, then renders it as an interactive HTML dashboard. It answers one central question: **for every keyword that matters, how much of the available search demand are we actually capturing?**

3,663

KEYWORDS IN MASTERLIST

PROJECT CONFIG — OIKOS USA

Client	Oikos USA
Period 1 (current)	Q1 2026 — Jan 1 — Mar 31, 2026
Period 2 (comparison)	Q4 2025 — Oct 1 — Dec 31, 2025
Masterlist Sheet ID	1W73Lzli30z4Gn0_WtLjs0hW0dPcEZw1jptXKG8exKoU
Masterlist Tab	Listing
Keyword Study Sheet ID	1rTdi4cLDiFudQHH8hj4V1GIQb8iKToKXRgFh1QcVHEI
Keyword Study Tab	Keyword study US
Reference Sheet ID	1o526Qv4UzP_Qfe-cjrfvcA7jRUi6zUtd9Ecp2WPMIhQ

SOURCE DATA

PLATFORM	WHAT IT CONTAINS	LOCAL FILE
Google Search Console	SEO clicks, impressions, CTR, position — per query, P1 vs P2	<code>gsc_export_queries_oikos.csv</code>
Google Search Console	Same metrics per landing	<code>gsc_export_pages_oikos.csv</code>

PLATFORM	WHAT IT CONTAINS	LOCAL FILE
	page	
Google Ads SQR	SEM search terms, clicks, cost, impressions — P1 vs P2	account_level_sqr_report_oikos.csv
Google Ads	Keyword Quality Score, landing page experience, ad relevance	quality_report_oikos.csv
SE Ranking	Organic position, search volume, CPC, search intent	se_ranking_april_oikos.csv
Keyword Study (Sheets)	Topics, Category, Sub-Category, 13 taxonomy tags, monthly volumes Oct 2025 – Mar 2026	Google Sheets (read via API)
GA4 (MikMak)	MM Checkout conversion events by landing page	ga4_oikos_conversions_mikmak_checkout.csv
GA4 (MikMak)	MM Offline Store conversion events by landing page	ga4_oikos_conversions_mikmak_click_offline_store.csv

PIPELINE — STEP BY STEP

- 1

Normalize all sources

Each source is read and cleaned independently: number formats standardized (French vs English), column names unified, rows without keywords dropped. GSC and SQR both handle comparison-mode exports with two periods side by side.

`ingest.norm_gsc()` · `norm_sqr()` · `norm_se()` · `norm_ks()`
- 2

Merge GSC + SQR → unified keyword spine

Full outer join on keyword text. Keywords with ≤ 1 click in both periods are dropped (noise filter). Result: ~3,663 unique keywords, each with SEO and/or SEM data. This is the spine everything else attaches to.

`merge.merge_gsc_sqr()` · `format_rows.format_base_rows()`

3

Build trigram (n-gram) index

Every keyword in the spine is broken into overlapping 3-character fragments (trigrams). A Jaccard similarity index is built on these fragments — built once, reused for all subsequent matching steps. This allows fuzzy matching: "greek yogurt" matches "yogurt greek", "greek yoghurt", "high protein greek yogurt".

`trigram.build_index()` · threshold: ≥ 0.50 for SE Ranking, ≥ 0.65 for Keyword Study auto-write

4

Match SE Ranking data

1,240 SE Ranking keywords are matched against the spine. Each match attaches organic position, search volume, CPC and search intent to the keyword row.

`match_se.match_se_keywords()` · 709 matches for Oikos USA

5

Match Keyword Study taxonomy

14,273 Keyword Study entries are matched against the same trigram index. Similarity ≥ 0.65 : auto-written to masterlist (Topics, Category, Sub-Category, 13 tag columns, 6 monthly volume columns). Similarity 0.50–0.65: sent to a KW Review tab for human approval.

`match_ks.match_ks_keywords()` · 956 auto-matched · borderline flagged for review

6

Join GA4 conversions

MikMak conversion events (Checkout + Offline Store) are matched to keywords via their SE Ranking landing page URL. When multiple keywords share a URL, conversions are split pro-rata by each keyword's Q1 SEO click share.

Writes: `Conversions SEO Q1 2026` (MM Checkout) · `Conversions SEM Q1 2026` (MM Offline Store)

7

Write masterlist + post-enrichment

All 3,663 rows $\times$ 57 columns are written to Google Sheets in batched API calls. ARRAYFORMULA cells (coverage ratios, estimated SEO cost) are written separately. After the main write, the SE Ranking API fills any remaining blank search volume cells.

Run: `python3 run_onesearch.py` · ~8 minutes total · zero LLM tokens

8

Build HTML dashboard

A separate script reads the completed masterlist, injects all data into a reference HTML template, applies brand-specific config (colors, regex, territory topics), generates the Territory Deep Dive and Recommendations panels, and writes a single self-contained HTML file.

Run: `python3 build_html_oikos.py` · ~45 seconds · zero LLM tokens

MASTERLIST COLUMN MAP (57 COLUMNS)

Identity & Classification (A–E)

COL	FIELD	SOURCE
A	Keyword	GSC / SQR merge
B	TOPICS	Keyword Study match or Claude taxonomy enrichment
C	CATEGORY	Keyword Study match or Claude taxonomy enrichment
D	SUB-CATEGORY	Keyword Study match or Claude taxonomy enrichment
E	LANG	Keyword Study, fallback to client language

SE Ranking & Volume (F–I)

COL	FIELD	SOURCE
F	Position SE Ranking	SE Ranking export → Position (fallback: GSC average position)
G	Average Search Volume	KS match → (Vol Q1 + Vol Q4) / 6, or SE Ranking API
H	Volume Q1 2026	Keyword Study monthly columns (Jan + Feb + Mar 2026)
I	Volume Q4 2025	Keyword Study monthly columns (Oct + Nov + Dec 2025)

Coverage (J–K) — ARRAYFORMULA

COL	FIELD	FORMULA
J	Coverage OneSearch Q1 2026	Clicks OneSearch Q1 / Average Search Volume
K	Coverage OneSearch Q4 2025	Clicks OneSearch Q4 / Average Search Volume

OneSearch Totals, Clicks, Impressions, CTR, Conversions, Cost (L–AK)

All SEO metrics sourced from GSC export. All SEM metrics sourced from Google Ads SQR report. Conversions sourced from GA4 MikMak exports distributed pro-rata. Cost SEO estimated as CPC × GSC clicks (ARRAYFORMULA). Each metric exists for both Q1 2026 and Q4 2025 to enable period-over-period comparison.

Taxonomy Tags (AL–AX) — from SE Ranking & Keyword Study

COL	TAG	COL	TAG
AL	Purchase intent (SE Ranking)	AT	Benefits
AM	Yogurt types	AU	Testimonials
AN	Taste	AV	Bio

COL	TAG	COL	TAG
AO	Packaging	AW	Moments
AP	Ingredient	AX	Recipes
AQ	Brands	AZ-BE	Monthly search volumes Oct 2025 – Mar 2026
AR	Retailer		
AS	Demography		

HTML DASHBOARD — WHAT IT CONTAINS

TAB	WHAT IT SHOWS
Overview KPI	Total demand, clicks, coverage, conversions, cost — SEO vs SEM vs OneSearch combined, Q1 vs Q4
Coverage by Topics	Gauge per territory showing coverage % vs target (3% generic, 10% brand)
Breakdown	Donut charts by Topic, Category, Sub-Category — clicks, impressions, conversions
SQR Detail by Keyword	Full paid search term table — demand, search volume, SEO vs SEM clicks, coverage, conversions, cost per keyword. Insight cards: Wasted Budget, Regressions, Rising Stars
Territory Deep Dive	Per-topic performance table (Q4 vs Q1), top keywords by OS clicks, Q1 SEO and SEM action cards with editable analyst notes
Recommendations	Sub-category level SEO/SEM priority matrix with editable analyst notes per row, exportable as JSON

BENEFITS OF THIS APPROACH

Runs locally — no infrastructure

Both scripts run in a terminal on a standard laptop. No server, no cloud function, no subscriptions. One `.env` file with credentials is all the setup needed.

Near-zero cost per run

Core pipeline makes zero LLM API calls. Only Google Sheets API (free) and SE Ranking API (minimal). A full end-to-end run costs under \$0.10 in API fees.

Deterministic — same data, same output

No prompt-to-prompt variation. The same masterlist always produces the same HTML. Every rebuild is identical. If something looks wrong, the cause is always in the data or the script.

Fast

8 minutes to populate a 3,600-row masterlist from scratch. 45 seconds to build the interactive HTML dashboard. A full refresh after new data takes under 10 minutes total.

**Replicable across clients**

New client = duplicate the build script, update 12 lines of config (Sheet IDs, brand colors, period labels). The brand-detection regex loads automatically from a reference sheet.

**Analyst time goes to insight**

Data assembly is fully automated. The dashboard opens ready for annotation — editable commentary boxes, JSON export/import, action card placeholders all built in.

HOW TO RUN

```
# Step 1 – Populate the masterlist (~8 min)
cd /Users/carlaklaasen/claude_code/one_search
python3 run_onesearch.py

# Step 1b – Taxonomy enrichment for unmatched keywords (optional, ~15 min)
python3 run_taxonomy_enrichment.py --brand oikos-usa

# Step 2 – Build the HTML dashboard (~45 sec)
python3 build_html_oikos.py

# Open the dashboard
open one_search_html/oikos_usa_onesearch_dashboard.html
```
